This work is part of "MOBILISE - Determinants of 'Mobilisation' at Home and Abroad: Analysing the Micro-Foundations of Out-Migration & Mass Protest" funded under the Open Research Area (ORA) scheme by ESRC (UK), DFG (Germany), ANR (France) and NWO Social Sciences and Humanities (the Netherlands).

¹ We would like to thank Piotr Goldstein and Kostiantyn Fedorenko for providing us with data on election results and helpful suggestions during the data collection. We also thank Sorana Toma for her helpful suggestions.

Abstract

The MOBILISE project examines why some people respond to discontent by protesting, others by migrating while yet others stay immobile. It focuses on four countries that have seen outmigration and protest in recent year (Ukraine, Poland, Morocco and Argentina) and migrants from these countries who live in Germany, the United Kingdom and Spain. Migrants were surveyed online and recruited into the sample through Facebook advertising. MOBILISE also conducted online surveys of the national populations of Argentina and Ukraine. This report explains why MOBILISE choose to recruit the sample through Facebook advertisements and provides detailed information on the set-up of the sampling. It also present an overview of the effectiveness of this method, in terms of costs, reach and bias, and of issues encountered. We find that sampling through Facebook advertisements is a cost-effective way to obtaining a large sample. The method seems particularly effective in reaching recent migrants and reaching migrants from small communities. There is some indication of a bias in gender, education and political interest. The paper ends with recommendations on the use of this approach for future surveys.

Introduction

The MOBILISE project seeks to understand why some people respond to discontent by protesting, others by migrating while yet others stay immobile. MOBILISE focuses on Ukraine, Poland, Morocco and Argentina; four countries that have experienced substantial outmigration and mass protests. It follows migrants from these countries to Germany, the United Kingdom and Spain. Data is collected through surveys, in-depth interviews, focus groups and social media.

The main body of MOBILISE survey data are nationally representative face-to-face surveys in Ukraine, Poland, Morocco and Argentina. As these surveys are unable to capture (current) migrants from these countries – a group that is crucial to answering the MOBILISE research question – MOBILISE employs a migrant survey targeted at three destination countries; Germany, the UK and Spain. The migrant survey was run online. We also ran two supplementary online national surveys targeting the general population in Ukraine and Argentina.

All MOBILISE national and migrant surveys are set-up as a two wave panel. The first wave of data collection for the migrant survey started in September 2019 and finished in March 2020. This paper outlines the set-up of the first wave of the migrant survey and the two online national surveys. It explains the choice for online convenience sampling and the implementation. The paper ends with an analysis of the performance of the sampling strategy and recommendations for future research. The paper is aimed at users of the MOBILISE data and researchers who are considering conducting an online survey.

Research design

To understand how migrants compare to non-migrants and return migrants, data of the migrant and national surveys need to be combined into one dataset. Two measures were taken to maximise the comparability of the migrant and national surveys. Firstly, the migrant surveys are timed to run as closely as possible to the national representative face-to-face surveys. This minimises the influence of any changes in the political situation in the origin countries on survey answers. Secondly, the surveys use the same questions as much as possible. The migrant survey questionnaire is a slimmed down version of the questionnaire used in the national f2f surveys plus an elaborated migration module.

The migrant survey was administered online with a sample mainly sourced through advertising on Facebook. To examine whether differences in survey mode – online vs face-to-face – and sampling – convenience vs representative – between the migrant and national survey affect the answer patterns, we conducted online national surveys in Ukraine and Argentina using the same sampling method as the migrant survey. The implementation of an online national survey during the second wave of the national face-to-face survey in Poland is being considered. Morocco requires a research permit for data collection. It is unclear whether this is necessary for online data collection. For this reason and to avoid issues for the research company conducting the face-to-face survey in Morocco, we decided not to conduct an online survey in Morocco.

Target groups

As MOBILISE studies migration as a response to discontent, the target group of the migrant survey is people who were born in one of the four MOBILISE countries – Poland, Ukraine, Argentina or Morocco – but do not reside there. The second and later generations are excluded. The target group comprises migrants with and without citizenship of the destination and/or origin country, and regardless of immigration status (regular or irregular).

The target group is restricted to migrants who at the time of the survey were residing in Spain, the United Kingdom, and Germany. These three countries were selected because they are all old EU member states, democracies, geographically close to the origin countries, and top destinations for migrants, particularly from the selected origin countries. The three destination countries vary in political discourse on immigration, the timing and concentration of migrant settlement, as well as migrants' access to political participation.

In the opening screen of the survey, respondents were asked to only continue if they were 18 years or older. To establish whether respondents belong to the target group, the migrant surveys started with two filter questions:

1. What is your country of birth?
2. In what country do you live and work? (if you move back and forward between countries, please list the country in which you spend most of your time)

Depending on the answers to these questions, respondents were directed to the start of the questionnaire or to the end screen of survey.

The online national survey in Ukraine and Argentina also started with filter questions.

1. What is your country of birth?
2. What is your country of residence?²

Only people who answered 'Ukraine' or 'Argentina' to both were directed to the questionnaire. Others were directed to the end screen.

Table 1. Size of migrant population by origin and destination country

| Group | Destination | Number | Year | Source |
|----------------------|----------------|---------------------|------|--------------------------------------|
| Argentinian migrants | Germany | 6,360 ¹ | 2019 | Ausländerzentralregister |
| | United Kingdom | 11,339 | 2015 | UNDP estimates |
| | Spain | 293,037 | 2020 | National Statistics Institute, Spain |
| Moroccan migrants | Germany | 128,000 | 2019 | Mikrozensus |
| | United Kingdom | 23,519 | 2015 | UNDP estimates |
| | Spain | 935,089 | 2020 | National Statistics Institute, Spain |
| Polish migrants | Germany | 1,638,000 | 2019 | Mikrozensus |
| | United Kingdom | 827,000 | 2019 | Annual population survey |
| | Spain | 49,245 ² | 2020 | National Statistics Institute, Spain |
| Ukrainian migrants | Germany | 264,000 | 2019 | Mikrozensus |
| | United Kingdom | 32,000 | 2019 | Annual population survey |
| | Spain | 116,155 | 2020 | National Statistics Institute, Spain |

Notes: ¹ based on citizenship, may include second generation, excludes naturalised migrants.

² According to data published by the Ministry of Inclusion, Social Security and Migration there were 102,918 Polish nationals with a residence card on December 31, 2019. It is not clear why this number is almost double that reported by the National Statistics Institute.

Size of target groups

Migrant communities from the four MOBILISE countries are present in all three destination but there are differences in the relative importance of each destination country. Table 1 shows estimates of the size of the target groups by origin and destination. Argentinian migrants are mostly found in Spain, this is unsurprising given the linguistic and former colonial relation. The Moroccan migrant community is also most populous in Spain – this is a consequence of the geographic vicinity and history of labour migration. Germany has the largest communities of

² This was only asked in the Ukrainian national online survey, not in the Argentinian survey.

Polish and Ukrainian migrants – this too reflects geographic vicinity and long-standing migration patterns. Furthermore, part of these communities were able to migrate to Germany because of their ethnic German or Jewish ancestry.

Sampling strategy

Choosing a strategy

Sampling migrants is notoriously difficult, especially in cross-national studies. Previous studies have resorted to varying strategies, such as sampling from population or foreigner register data, Random Digit Dialling (RDD) (Schaeffer et al, 2011), surname sampling from telephone directories (Ersanilli & Koopmans, 2013), Respondent Driven Sampling (RDS) (Carling & Jolivet, 2017), snowball sampling, intercept-point sampling (McKenzie & Mistiaen, 2009), cross-national snowball sampling (Güveli et al, 2017), and online convenience sampling (Balter & Brunet, 2012; Pötzschke & Braun, 2017). Each of these strategies has its strengths and weaknesses (see McKenzie & Mistiaen, 2009; Ersanilli & Koopmans, 2013; Reichel & Morales, 2017; Andreß & Careja, 2018).

Before choosing a sampling strategy, we determined conditions that the sampling method should fit the goals of the MOBILISE project. The first condition was that the sampling method provides nation-wide coverage of the migrant population in each destination country. This is important because network migration may lead to variation in socio-demographic characteristics or political orientation of the migrant population between localities in destination countries. Furthermore, migrants in localities with few co-ethnics may differ from migrants living in areas with a high concentration of co-ethnics. As one of the key goals of MOBILISE is to compare migrants to those who did not migrate (or returned), it would be problematic if the sampling method only covered a limited number of localities.

Several of the MOBILISE target communities such as Argentinians in Germany are very small. Achieving a nationwide sample of sufficient size with a face-to-face survey is likely to entail prohibitively high travel costs. The second condition was therefore that the sampling method should allow the survey to be conducted via phone or online.

The final condition was that the sampling strategy should cover recent arrivals and irregular migrants. Changes in the economic or political situation in the origin country, may lead to changes in the characteristics or political views of the people who emigrate. Recent migrants may therefore differ from previous migrant in important ways. It is similarly likely that there are differences between migrants with regular and irregular migration status.

Table 2. Sampling methods compared on selection conditions

| Methods | Nation-wide coverage | Suitable for phone or online survey? | Covers recent arrivals and irregular migrants |
|----------------------------------------|----------------------|--------------------------------------|-----------------------------------------------|
| Register data | Yes | No | Unlikely ¹ |
| Random Digit Dialling (RDD) | Yes | Yes | Yes |
| Surname sampling telephone directories | Yes | Yes | Unlikely |
| Respondent Driven Sampling | Difficult to achieve | Yes | Yes |
| Intercept point sampling | Difficult to achieve | No | Yes |
| Snowball Sampling | Difficult to achieve | Yes | Yes |
| Cross-national snowball sampling | Yes | Yes | Yes |
| Online convenience sampling | Yes | Yes | Yes |

¹ See e.g. Andreß & Careja (2018).

Table 2 shows to whether commonly used sampling methods meet the conditions set for the MOBILISE project. Three methods meet all conditions: RDD, cross-national snowball sampling and online convenience sampling. While RDD meets all three conditions, the small size of the target communities and the predominance of mobile phones would make the screening costs prohibitive (Pötzschke & Braun, 2017; Reichel & Morales, 2017). Cross-national snowball sampling turns the usual weakness of snowballing – recruiting people who are similar to each other – into a strength, resulting in a quasi-experimental data collection. Several multi-sited projects used cross-national snowballing to reach migrant family members of respondents interviewed in the origin countries. The strategy has proven highly successful in some cases (Güveli et al 2017), but close to fruitless in others (Beauchemin & González-Ferrer, 2011). The EU General Data Protection Regulation (GDPR) which came into force in 2018, restricts the possibility to ask respondents for contact details of third parties.³ While we could have opted to ask respondents to forward contact information of the MOBILISE team to their migrant relatives and friends, this strategy is unlikely to have led to much response unless combined with a material incentive. The MOBILISE budget did not allow for such an incentive. We therefore considered this method unsuitable.

The sample for MOBILISE was drawn through online convenience sampling. This approach meets all three conditions. The major advantage of online convenience sampling compared to other convenience methods and to probability methods commonly used in migrant research, is that it allows obtaining a destination country wide sample of each migrant target community, irrespective of citizenship and legal status. Tools such as Facebook ads allow researchers to advertise their study to a large and geographically diverse audience at low time and financial cost. There are several disadvantages to online convenience sampling such as limiting the sample to people who are (frequent) internet users and moreover to users of the selected recruitment platforms. Furthermore, as social media companies do not publish their algorithm it is unclear how exactly the program decides who to show the survey ad to and whether people are more likely to see the survey ad if they are connected to people who previously clicked on the ad link. While these issues lead to a sampling bias, this sampling bias does not necessarily lead to biased population estimates. The bias in the estimates depends on whether or not the sampling strategy is related to a confound of the question of interest (Cornesse et al 2020). For example, if social media use and the algorithm behind the advertisement are unrelated to migrants' protest history, the survey will produce accurate estimates of migrants' protest history. For survey experiments, sampling bias is even less problematic. In a study exploring different types of non-probability samples, Mullinix et al (2015) found that that estimates of treatment effects tend to be similar to those based as probability based population samples.

In the section *Sample composition* below we examine how the migrant sample compares to population data and how the online and face-to-face national surveys compare.

Online strategies

An exploration of approaches to online convenience sampling showed that Facebook advertising is the best way of reaching the MOBILISE migrant target groups. In this section we will first explain how we set up the Facebook ads. This is followed by a brief discussion of the other methods that were used but halted due to low returns; Facebook community groups, VK ads, and Google ad words.

³ Art. 6 Lawfulness of processing, Art. 7 Conditions for consent.

Facebook ads

MOBILISE Facebook page

As a first step we set up a separate MOBILISE Facebook page in the national language for each origin country group (Argentiniens, Poles, Ukrainians). To increase perceived legitimacy, posts were added to the Facebook pages prior to launching the ads. The pinned post at the top of the page offered a short description of the MOBILISE project. A second post shows a picture of one of the project team members giving a presentation. The slide behind the presenter is headed ‘focus groups and interviews on protest & migration’. An example of a MOBILISE Facebook page can be found in Figure 1.

The main reason to set-up separate Facebook pages for each language was to make a more legitimate impression. A Facebook page in five languages and three different scripts (Latin, Cyrillic, and Arabic) may have looked suspicious to potential respondents. As the Ukrainian survey is bilingual we set up two separate Facebook pages, one targeting Ukrainian-speaking Ukrainians, and one targeting Russian-speaking Ukrainians. The Facebook pages used for the Ukrainian national survey also had two separate pages. In response to comments on the Facebook ad, we added a reference to the Ukrainian language page to the Russian language page.

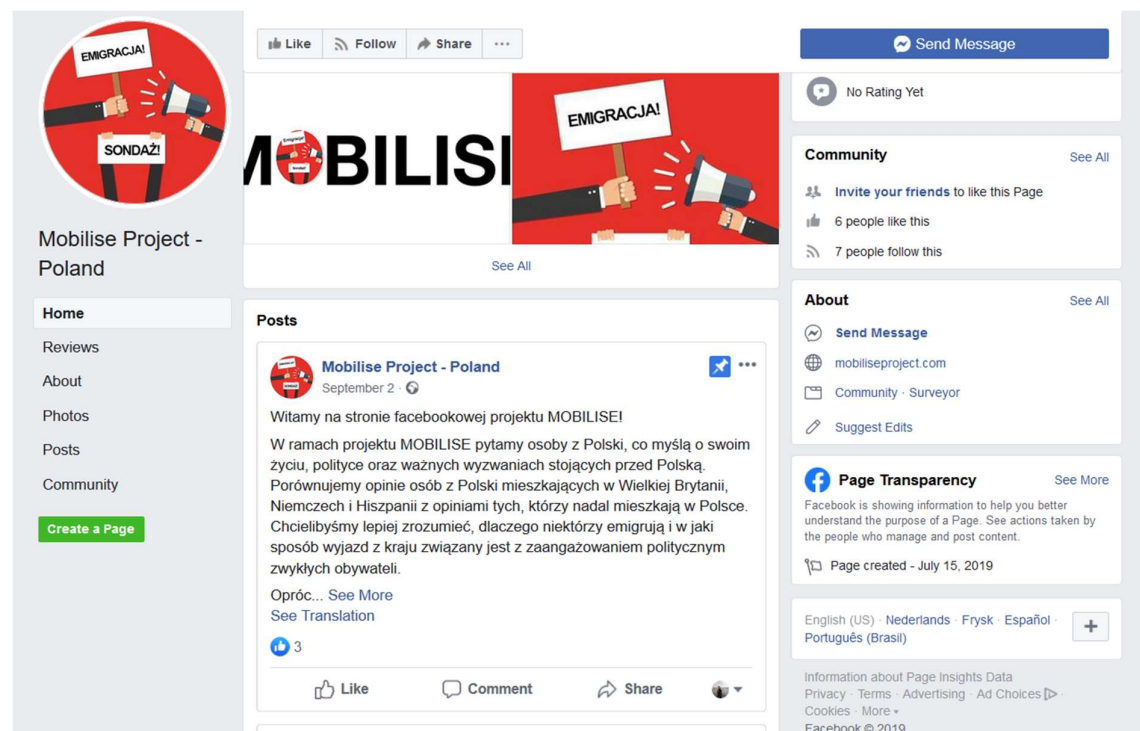

Figure 1. Example MOBILISE Facebook page: Polish migrants

Ad design

Facebook ads consist of a headline, body text, link description and image. Following the recommendations of Pötzschke and Braun (2017), MOBILISE ads used minimal text and images. Facebook recommends using a body text of up to 125 characters so that it can be displayed in full, rather than behind a ‘read more’. The recommendations by Facebook are intended to increase the reach of the ad, which is why MOBILISE followed these directions. The ads were translated by native speakers and —where necessary— shortened to fit the character limits. The ads for

Ukrainian migrant and national online surveys were distributed in Ukrainian and Russian. The link in the ad directed respondents to Qualtrics, the platform used to conduct the online survey.

Pöttschke and Braun note that since Facebook is a visual medium, choosing the right image is vital (2017). The MOBILISE project logo is bright red with banners displaying the words ‘migration!’ and ‘protest!’. However, as the word ‘protest!’ might influence respondents to interpret the questions in a particular way or deter some potential respondents altogether, the logo in Facebook ad and page shows the more neutral ‘migration’ and ‘survey!’. The same image was used for the page’s profile picture. Figure 2 shows an example of an ad for the migrant survey. The logo in the ad for the national survey only had a sign reading ‘survey’. An example of the national survey ad is shown in Figure 3. The logo in both types of ad is the same.

The ad for the migrant survey read:

Headline: Argentínians/Poles/Ukrainians abroad

Body text: Were you born in Argentina/Poland/Ukraine and do you live in Germany, UK or Spain? If so, you are invited to participate in our survey.

Link description: We invite you to participate in our survey!

The ads for the national survey in Ukraine and Argentina read:

Headline: Survey of Ukrainians

Body text: Are you Ukrainian ? If so, we invite you to participate in our survey!

Link description: Ukrainian version here

Headline: Survey of the Argentine population

Body text: We are interested in your opinion: Tell us what you think about life, society and politics in Argentina.

Link description: Participate in our survey!

Figure 2. Example composition of MOBILISE Facebook ad – Argentinean migrant survey.

The wording in the ads for the Ukrainian national survey caused some confusion among Facebook users. The question “are you Ukrainian” was understood as a question about ethnicity, meaning that people living in Ukraine that were ethnically Russian questioned whether they should participate in the survey. A moderator clarified to those commenters that the ad was targeted towards Ukrainian residents who were born in Ukraine. Future surveys on the population of Ukraine should keep this in mind consider using the wording “are you a resident of Ukraine?” in the ad headline.

Figure 3. Example composition of MOBILISE Facebook ad – Argentinian national survey.

Campaign objective, targeting settings and performance

We choose “traffic” as campaign objective. This is the same as Pötzschke and Braun (2017) selected for their study. Under this campaign objective, the Facebook algorithm detects which kind of users are most likely to click on the ad and shows the ad to users with a similar profile (Neundorf & Öztürk, 2021).

Facebook offers a variety of targeting strategies to increase the probability that the ad is shown to the target group. The basic settings can be used to target ads at specific locations, age, gender, and languages. The detailed targeting options are focused on interests, behaviours, and demographics. The targeting is based on the information that users have entered in their profiles.

In their study on Polish migrants, Pötzschke and Braun (2017) set their ad to target the behaviour “expats [home country]”. Since their study, Facebook Ads changed the name of this behaviour to “lived in [home country]”. As Rampazzo et al (2021) note, it is not clear whether the change in wording was accompanied by a change in the definition of the target group. The authors found that there was a considerable drop in the number of people falling under Facebooks migrant category in early 2019, which cannot be explained by migration flows (Rampazzo et al, 2021). This suggest the definition has changed, but it is not clear how as Facebook does not provide any information on how it determines whether an account holder falls into this category.

Table 3. Targeting strategies and cost per respondent for MOBILISE Facebook ads

| | Location - behaviours | Duration | Cost | Reach | Link clicks | Cost-per-click | Opened survey | Answered filter questions | Target group | Cost per target group respondent |
|----------------------------|-----------------------------------------------------------------|----------|-------|---------|-------------|----------------|---------------|---------------------------|--------------|----------------------------------|
| Argentina: migrant | Spain – lived in Argentina | 42 days | €450 | 68,288 | 6,273 | €0.07 | 961 | 862 | 853 | € 0.53 |
| | Spain – language/interest | 28 days | €150 | 62,751 | 952 | €0.16 | 71 | 59 | 56 | € 2.68 |
| | Germany – lived in Argentina | 42 days | €450 | 8,706 | 1,195 | €0.38 | 315 | 283 | 273 | € 1.65 |
| | Germany – language/interest | 28 days | €150 | 41,711 | 441 | €0.34 | 74 | 59 | 58 | € 2.59 |
| | UK – lived in Argentina | 42 days | €450 | 8,100 | 1,175 | €0.38 | 308 | 285 | 281 | € 1.60 |
| | UK – language/interest | 28 days | €150 | 15,256 | 340 | €0.44 | 65 | 58 | 56 | € 2.68 |
| Argentina: national | Argentina | 22 days | €200 | 220,289 | 13,053 | €0.02 | 4,526 | 4,354 | 4,308 | € 0.05 |
| Poland: migrant | Spain/Germany/UK – lived in Poland | 68 days | €1700 | 167,401 | 10,368 | €0.16 | 4,390 | 3,860 | 3,521 | € 0.53 |
| | UK – lived in Poland ¹ | 10 days | €150 | 10,568 | 627 | €0.24 | | | | |
| Ukraine: migrant | Spain/Germany/UK – Russian – language + interest: Ukraine | 36 days | €400 | 36,912 | 2,765 | €0.14 | 841 | 701 | 612 | € 0.65 |
| | Spain/Germany/UK – Ukrainian – language/interest/away from home | 36 days | €400 | 35,688 | 3,811 | €0.10 | 1,592 | 1,375 | 1,255 | € 0.32 |
| | Spain/Germany/UK – Ukrainian – language | 36 days | €400 | 45,144 | 3,954 | €0.10 | 1,683 | 1,463 | 1,340 | € 0.30 |
| | UK – Russian – language | 25 days | €180 | 24,000 | 518 | €0.35 | 71 | 52 | 37 | € 4.86 |
| | UK – Ukrainian – language | 32 days | €280 | 16,220 | 1,363 | €0.21 | 549 | 472 | 431 | € 0.65 |
| Ukraine: national | Ukrainian – language | 10 days | €83 | 58,559 | 7,435 | €0.01 | 1,920 | 3,134 | 2,908 | € 0.03 |
| | Russian – language | 10 days | €83 | 54,054 | 6,197 | €0.02 | 3,713 | 1,511 | 1,286 | € 0.06 |
| | Combined ² | 2 days | €34 | | | | 1,136 | 948 | 848 | € 0.04 |

Notes: Response marked as spam by Qualtrics and duplicates are excluded from these calculations. In a small number of cases the ad recruited people from different target countries than intended; e.g. the ad targeted at Ukrainians in the UK resulted in responses from Germany.

¹ Response generated by this ad were not tracked separately from the main ad.

² The first two days performance wasn't tracked per language.

The “*lived in [home country]*” setting was applied in the Polish and Argentinian migrant survey ads. As this option was not available for Ukrainian migrants, the ad targeting for this group was based on “*language*”, and “*interest: [home country]*” and/or the identifier “*away from home*”.

The response for the Polish and Ukrainian migrants surveys varied by destination country. When setting up the ads for the Argentinian migrant survey, we therefore decided to split them by destination country. As the language & interest targeting proved successful for Ukrainian migrants, the Argentinian migrant survey ad was set up in two ad sets; one targeting “*lived in [home country]*” and the other targeting “*language*”/“*interests: [home country]*”. The Argentinian migrant survey started out with six separate ads; two ad sets with one ad per destination country.

The “*language*” strategy was significantly less effective compared to the “*lived in [home country]*” strategy. In the United Kingdom ads, the “*language*” option delivered 20% fewer respondents compared to the “*lived in [home country]*” advertisement. In Germany the “*language*” ads delivered 50% fewer respondents and in Spain even 75% fewer than the “*lived in [home country]*” ads.

For the Ukrainian migrant survey the “*language*” strategy worked well, since people who set their default language as Ukrainian are likely to be Ukrainian. However, speaking Spanish is not unique to Argentinians, making it likely that a lot of people outside the target group were reached by this ad-set. Furthermore, people who are not from Argentina might select Argentina as one of their interests on Facebook, for example because they are interested in Argentinean football. Because of the stark difference in performance, the “*language/interest*” ads were suspended after three weeks, and the remaining budget was added to the “*lived in [home country]*” ads. Appendix 1 provides a full overview of Facebook ad targeting settings for each target group.

Table 3 shows the performance and costs of the different ads by target group. The cost per respondent is influenced by the Facebook bidding process, the estimated reach of the ad, and the ad’s accuracy in reaching the target group. The price of Facebook ads is determined through an automated bidding process. We set a budget at the start of each ad and choose the option for Facebook to optimise spending. Generally, this setting results in the price per click increasing over the lifespan of the ad. We adjusted the budget of an ad depending on the performance and the number of completed surveys. If an ad delivered poorly, we sometimes adjusted our strategy. For example, Table 3 shows that for the Argentinean migrant survey, the two strategies for Germany had a similar cost-per-click. However, the “*lived in [home country]*” ad lead to much more respondents in comparison to the “*language/interest*” ad, resulting in a much higher cost per target group respondent for the latter ad. It was therefore decided to adjust the strategy, and terminate the “*language/interest*” ad.

For all strategies, only a minority of people who clicked on the link in the ad filled out the survey and even fewer completed the survey (see below). Findings by Neundorf & Öztürk (2021) suggest that choosing “conversion” rather than “traffic” as campaign objective might have increased the share and number of link click leadings resulting in completed surveys. The conversion strategy requires the use of a pixel that lets Facebook know which kinds of users participated in the survey. This requirement raises ethics questions that limit the potential use of this campaign objective.

Emerging issues

One of the advantages of using Facebook ads is the low cost. This comes at the price of not having the possibility of contacting a helpdesk. Facebook has become increasingly active in banning posts and links that are flagged as violating community guidelines. It is not possible to get information from Facebook on why a post or link is banned. It is possible to object to the ban, but only via an online form which explicitly states not to expect a reply.

The MOBILISE online survey was hindered by several bans. The MOBILISE survey was conducted through the survey platform Qualtrics. At the launch of the survey for Ukrainian migrants, Facebook flagged the Qualtrics survey URL as a violation of community guidelines, and banned its distribution. Since the survey had not yet been launched, it was unlikely that the violation pertained to the content of MOBILISE survey. The Qualtrics helpdesk suggested the problem might be that a previous survey distributed using a University of Amsterdam Qualtrics URL had been flagged resulting in Facebook's rejection of all surveys distributed with the URL. Using a different URL that did not contain the name of the institution but still directed to the same survey, solved the issue.

The MOBILISE project website was blocked by Facebook. This made it impossible to share the link to the project information sheet on Facebook, or to refer participants to the website for more information about the project via the Facebook page.⁴ After several weeks and multiple submissions of the form objecting the ban and explaining the legitimacy of our project, the link was unblocked.

During the Ukrainian national survey ad campaign, our Facebook ad account was suspended for violating community guidelines. The suspension happened right after the launch of the Ukrainian ads, but was quickly repealed after a short message to Facebook explaining the intent of the ad, and an explanation that this particular ad had run before, and was now running in a different language. The ad account was restored within a few hours. The suspension happened once more halfway through the distribution of the Ukrainian ads, and was again lifted within a few hours.

In addition to blocks of the survey URL and project website, we encountered another type of challenge with using Facebook ads for survey recruitment. The MOBILISE Facebook ads appeared on users' timelines as a regular post. This means that users can also comment on, like, and share the post. While liking the ad may increase visibility of the survey, it may also skew the response. A further risk is that comments prime respondents before replying to the questions or make them reject the survey altogether. As we did not find a way to disable comments, we instead decided to monitor them. Throughout the MOBILISE Facebook ad campaigns comments were monitored every two to three days. Moderation was kept to a minimum. Hateful comments were hidden, so that the commenter could still see their own comment, but other commenters could not see it. The choice to hide comments instead of deleting was to avoid accusations of censorship. When commenters asked about the nature of the survey or about what would happen to the data, we referred to the project information sheet, which explains the rights of the participants as well as how the data will be used and stored. The Ukrainian survey received critical comments from Ukrainians who were upset by receiving an ad about Ukraine written in Russian. That specific ad was targeted to Facebook users who had their language set to Russian, it was therefore unexpected that Ukrainian-speaking Ukrainians saw this ad. To remedy the issue, a short comment in Ukrainian with a link to the Ukrainian ad was added to the Russian ad.

Facebook community groups

Balter & Brunet (2012) used Facebook groups to recruit respondents for a survey among Argentinian entrepreneurs in Spain. The MOBILISE team drew up a list of Facebook groups for Ukrainian migrants using 16 search terms including as "Ukrainian church", "Ukrainian art / Ukrainian artists", "Ukrainian migrants", "Ukrainian workers", "Ukrainian culture", "Ukrainian business". Terms were entered in English, Ukrainian and Russian. The search resulted in 211 groups that had 30+ members and were active within the last two years. Distribution of the survey

⁴ Respondents could still access the project website and the project information sheet through links on the opening screen of the survey.

through in community groups proved to be a lot of work; it required reaching out to admins from the groups to ask for permission to post the link to the survey. Additionally, some community groups required filling out a number of questions (such as: “were you born in Ukraine?”) in order to gain access to the group. In those instances, we answered truthfully and explained that we were part of a research team. As a result, certain groups rejected our request to join their group. In the end it was possible to post the announcement of the survey in only 55 of the groups. The posts led to only 34 responses. It was therefore decided to abandon this strategy for later surveys.

VK ads

To achieve a wide reach of the Ukrainian migrant community we supplemented the Facebook ads with ads on VK (formerly VKontakte). VK is a social media platform popular with Russian speakers. The VK ad module does not offer the option of targeting users with certain characteristics. VK ads could only be run by targeting specific VK community groups. Because there were only a small number of community groups specifically targeted towards Ukrainian migrants, the MOBILISE ad was barely distributed. After 26 days, the VK ads had only generated 8 complete surveys. We then suspended the VK campaign and used the remaining budget to prolong the Facebook ad campaign.

The screenshot shows the Google AdWords interface for a campaign titled "About this campaign". The campaign goal is "Website traffic" and the bid strategy is "Maximise clicks". The campaign is scheduled from 30 Sep 2019 to 6 Oct 2019, running all day, targeting Germany, with languages set to German and Polish.

Under "Ad groups", there are two groups:

- Ad group: POL DE - election**
 - Type: Standard
 - Keywords: Gdzie głosować, Jak się zapisać na wybory, Wybory 2019, Wybory do parlamentu + 2 more
 - Ad extensions: None
- Ad group: POL DE - non election**
 - Type: Standard
 - Keywords: Konsulat, Paczki do Polski, Polska szkoła, Polski paszport + 2 more
 - Ad extensions: None

Each ad group has an example ad preview showing the ad text: "Badanie Polonii | Polacy w Niemczech | ... Jesteś z Polski i mieszkasz w Niemczech... Wypełnienie ankiety zajmuje około 20-2..."

Figure 4. Example Google Ad Words Setting – Target: Polish migrants in Germany

Google Ad Words

For the Polish migrant survey, we supplemented the Facebook ads with Google Ad Words. Google ad words displays the ad to users based on their search terms. It is not possible to target the ad at specific types of users. We set up two sets of ads: one set with election related search terms (2019

elections, parliamentary elections) and one with more neutral terms (Polish supermarket, Polish school, Polish passport). Separate ads were set up for each of the three destination countries. We set a daily budget of €8 (UK, Germany) to €15 (Spain). Figure 4 shows the settings for the ad for Polish migrants in Germany. After two weeks, the Google Ad Words resulted in 9 completed surveys at a total cost of €156,04. Given the lack of results, the Google Ad Words campaign was terminated.

Data collection

The migrant survey was run through the online survey platform Qualtrics. Participants were not offered any (financial) incentives for their participation. The online surveys were conducted between September 2019 and March 2020. Table 4 lists the start and end date of each survey. The recruitment for the national online surveys ran for about two weeks. The migrant survey recruitment ran until satisfactory respondent numbers were reached for all three destination countries. In some cases this required launching additional Facebook ads for one of the destination countries. For example for Ukrainians and Poles in the United Kingdom (see Appendix 1 and Table 3 above for full details).

Table 4. Data collection period per online survey

| | Start date | End date |
|-----------------------------|--------------|--------------|
| Polish migrant survey | Sept 3, 2019 | Nov 16, 2019 |
| Ukrainian migrant survey | Nov 14, 2019 | Jan 21, 2020 |
| Ukrainian national survey | Dec 19, 2019 | Dec 31, 2019 |
| Argentinian migrant survey | Feb 17, 2020 | Mar 30, 2020 |
| Argentinian national survey | Mar 9, 2020 | Mar 31, 2020 |

For Poland the migrant and national f2f surveys were conducted in September 2019. The migrant survey was paused on October 11 and reopened on October 19 after the Polish parliamentary election of October 13. As about 40% of the surveys were completed after the elections compared to 60% before, the data allows a basic investigation of the effect of the election results on the attitudes measured in the survey.

The Ukrainian national f2f survey was fielded in March 2019 – before of the first round of the presidential election. As this was just after the official start of the MOBILISE project, it wasn't possible to conduct the Ukrainian migrant survey at the same time. The migrant survey for Ukraine went online in November 2019 - after the second round of the presidential elections (April 2019) and the parliamentary election (July 2019). The online national survey in Ukraine went live in December 2019.

The Argentinian migrant survey went live within days of the start of the Argentinian national f2f survey. The Argentinian online national survey went live three weeks later. The response to the migrant survey was slower than for Polish and Ukrainian migrants – probably a reflection of the smaller size of the target population. When the COVID-19 crisis started to unfold, comments on the survey ad suggested respondents' answers were being influenced by the crisis. While the crisis could have been an interesting natural experiment, too few migrants filled in the survey prior the start of the crisis to have enough analytical power to analyse its effects. We therefore stopped the two surveys earlier than planned. The Argentinian migrant survey did not reach the target number of respondents. Despite its later launch – on March 9, 2020 –, the national survey did reach the target number of respondents.

The survey for Moroccan migrants was due to start in late March. Due to the COVID-19 crisis we decided to abort the data collection: the influence of the (handling of) the COVID-19 crisis in Morocco and the destination countries was likely to impact the response to the questionnaires, making the data incomparable to the data collected in through f2f surveys in Morocco which started in early March.

Questionnaire

The absence of an interviewer makes an online survey more vulnerable to drop-out than a face-to-face survey. The migrant questionnaire therefore used a shortened version of the questionnaire used in the national face-to-face surveys.

Questions were adapted to fit the migrant situation when needed. For example the question “*What is your main source of information about political events?*” was split into two questions, one referring to the origin country, and one to the country of residence. The migration module was extended to cover migration history and return intention. The full questionnaire can be found in Appendix 2.

In the national survey, the demographic questions were at the end of the questionnaire. Initially we used the same order in the migrant survey. However, threequarters into the data collection⁵ of the Ukrainian migrant survey, we decided to move questions on key demographic characteristics (year of birth, gender, level of education) to the front of the survey. That way, valuable information about respondents could be collected, even if the respondents dropped out before the end of the survey. The surveys that followed (Ukrainian national, Argentinian migrant and national) used this order of questions from the start of the survey.

Languages

All surveys were offered in the official language of the (origin) country and in English. The Ukrainian migrant and national surveys were also offered in Russian. This is in line with common practice for social scientific research in Ukraine. The questionnaires were translated by professional translators. Team members with relevant language skills checked the quality of the translations and ensured that the translation used in the national f2f survey and the online surveys were as similar as possible.

Table 5. Language use by survey.

| | <i>Migrant survey</i> | <i>N</i> | <i>National online survey</i> | <i>N</i> |
|-----------|--------------------------------------------------|----------|--------------------------------------------------|----------|
| Argentina | Spanish (99%) English (1%) | 615 | Spanish (100%) English (0%) | 1,961 |
| Poland | Polish (99%) English (1%) | 1,273 | - | |
| Ukraine | Ukrainian (82%) Russian (18%) English (0%) | 1,470 | Ukrainian (80%) Russian (20%) English (0%) | 2,151 |

Note: Complete surveys only.

There are some minor differences between translations used in the national face-to-face survey and the migrant and national online surveys. For example, the Ukrainian online surveys asks: “*There are many things people can do to **prevent or promote change**. During the last 12 months, have you done any of the following?*”, while the corresponding question in the national face-to-face

⁵ On December 13.

asks Survey: “There are different ways of trying to **improve things in [country] or help prevent things from going wrong**. During the last 12 months, have you done any of the following?”. We therefore recommend users of MOBILISE survey data to always check the code book for the exact phrasing in all surveys included in their analyses.

Most respondents filled out the survey in the national language (see Table 5). In the Polish survey the English text did not match the Polish translation for the question on religious denomination and for social media use. When including this question in an analysis, users may want to do a robustness check excluding respondents who completed the survey in English (9 out of 1,273 completed surveys).

Survey duration

Qualtrics automatically registers the start and finish time of each survey and uses this information to calculate the duration. If respondents pause the survey they can return to continue it. In these cases, Qualtrics registers the time elapsed from the moment the first question was answered until the final question was answered. After two days of non-activity the survey is closed by Qualtrics. The median duration is very similar across surveys at just over twenty minutes.

Table 6. Survey duration in minutes by target group.

| | Median | Mean | SD | Min | Max | N |
|-----------------------------|--------|------|-------|-----|--------|-------|
| Argentinean migrant survey | 23.4 | 45.3 | 317.2 | 9.6 | 7727.2 | 615 |
| Argentinean national survey | 22.3 | 25.9 | 27.8 | 9.1 | 625.8 | 1,961 |
| Polish migrant survey | 21.9 | 33.5 | 62.6 | 9.5 | 837.9 | 1,271 |
| Ukrainian migrant survey | 22.2 | 33.6 | 63.0 | 7.6 | 1262.9 | 1,470 |
| Ukrainian national survey | 22.4 | 26.4 | 24.1 | 8.3 | 610.0 | 2,151 |

Note: Complete surveys only.

Ethics

The data collection for the MOBILISE project was submitted to the ethics review boards of the VU University Amsterdam (approval obtained 20 November, 2018).

The opening screen of the survey in Qualtrics explained that participation is confidential and voluntary (see Appendix 2). It referred people to the MOBILISE website for more information on the project and their rights (see Appendix 3. Project Information Sheet). Respondents could download the project information sheet (pdf-file). The opening screen and the project information sheet were translated into the languages of the origin countries.

The Qualtrics online survey platform is GDPR compliant. Among others this means that data are stored in EU data centres and encrypted using AES-256 cypher⁶.

Qualtrics offers the option to prevent ballot stuffing, i.e. people answering the survey multiple times. This works through leaving a cookie in the browser of the respondent. This option should thus only be selected if there is a substantial risk of ballot stuffing. We considered the risk of multiple entries low of the MOBILISE surveys. The surveys are fairly long and there is no financial reward for participating in the survey.

The challenge with online panels, especially those recruited through advertisements, is that it is unclear who is participating in the survey. To get a rudimentary idea about the respondents we enabled IP-address based geolocation in Qualtrics. This enables us to check the answer to the

⁶ <https://www.qualtrics.com/support/survey-platform/getting-started/qualtrics-gdpr-compliance/>

country of residence question matched the country people were in⁷ at the time of the survey. IP address and location information are deleted from the dataset before it was shared in the MOBILISE team. This information will also be removed from any future data deposit. The Project Information Sheet explains why IP addresses are collected and how they are used.

Except for the matrix questions, all questions in the survey were mandatory, i.e. respondents could not continue the survey without answering each question. All mandatory question offered respondents the option to fill out “don’t know” or “refusal”.

The surveys are designed as a two-wave panel. At the end of the survey, respondents were asked if they are willing to participate in future surveys and if so to enter their email address. The email addresses are solely used to send out the second wave of the survey. They will be deleted afterwards. The email addresses, IP addresses and location information are deleted from the data files before the files are shared within the MOBILISE team and will be removed from any future data deposit. The files with this information have also been deleted from the Qualtrics server. Copies of the raw data including contact information are stored as encrypted files on a university approved secure cloud server. In line with the projects data management plan approve by the University of Manchester, these files will be destroyed five years after the end of the project.

The MOBILISE Facebook ads were open to commenting, which means additional data could be gathered from this. The separate Facebook pages therefore each had a post explaining that comments were encouraged, and that the comments may be used anonymously for qualitative analysis. The posts were in the language of the ad, and the text was also pasted as a comment under the ad in question for more visibility.

Data cleaning

In the data cleaning process, extreme values in the dataset were detected and corrected if necessary. Numeric values, such as year of birth and migration year, were only corrected if there was no doubt what the respondent had intended. Shortened versions of birth years, such as ‘79’ were changed to four digit notation (1979), so that there would be no inconsistencies across the dataset. If the correct answer was not self-evident, responses were set to missing.

Qualtrics flags a response as a possible spam response when multiple identical responses are submitted from the same IP address within a 12-hour period. Of course, it is possible that multiple members from the same household fill out the survey, which would lead to multiple responses registered to the same IP address. Qualtrics therefore also takes the similarity of the responses into account. Considering the length of the MOBILISE survey, it is unlikely that members from the same household would have identical responses. The number of responses marked as spam was low in every survey. A quick manual check was done on responses flagged as spam before removing them from the dataset. As expected, in most cases, the responses that were flagged by Qualtrics as spam did not make it far into the survey. In two cases in the Ukrainian migrant survey, the check showed responses were incorrectly marked as spam. One further duplicate in the Polish migrant survey was uncovered by comparing answers to open questions and IP address. The second copy was removed.

We discovered duplicates in the email addresses entered for participation in the second round of the survey. We also found duplicates in IP addresses. While it is theoretically possible that two different respondents have the same IP addresses – for example if they filled out the survey while

⁷ If respondents used VPN there IP address location is linked to the location of the VPN server, rather than their own location at the time of the survey.

connected to the same mobile phone mast – it is unlikely given the small number of surveys compared to the size of the countries included in the study. These duplicate responses weren't marked as spam by Qualtrics as the entries generally show minor differences in the answers to survey questions. In most surveys the share of duplicates are small, for the Argentinean and Ukrainian migrants surveys it was less than one percent of all completed surveys. For the Polish migrant survey and the Ukrainian national survey it was close to two percent. The Argentinian national survey had a comparatively high share of duplicates: 12.5 per cent of all completed surveys had duplicate email or IP addresses. One respondent appears to have participated as many as seven times. It is not clear what drives these repeated responses; the survey ad and participant information do not mention a price or financial compensation. The email addresses in the duplicates look legitimate as does the duration of the survey (hovering around the median), there is a high level of similarity in answers between copies and duplicates tend to be filled out one or more days – and in some cases several weeks - apart. For surveys with duplicates IP address or email address we retained the most complete copy. In case of two or more equally complete copies, the first copy was retained. This is in line with what other studies collecting data through Facebook have done (Rosenzweig et al, 2020; Iannelli et al, 2020).

We added a variable differentiating four response categories:

- 1) Opened survey but did not answer any questions
- 2) Opened survey but was not part of target group (determined based on replies to filter questions)
- 3) Part of target group, answered several questions but did not complete survey
- 4) Part of target group and completed survey (measured as answering questions up to "next01" on participation in the second wave)

Response

The aim was to survey 500 migrants from origin country in each of the destination countries. This was achieved in about half the cases. Table 7 shows the number of respondents by target group and destination country. As mentioned above, the numbers for Argentinean migrants are lower in part because the recruitment was halted due to the COVID-19 crisis.

One of the strategies we used to minimise survey fraud was to collect information on the location of respondents at the time they filled out the survey (see also ethics section). A comparison between this information and respondents' answer to the question *"In what country do you live and work? (if you move back and forward between countries, please list the country in which you spend most of your time)"* showed strong overlap; varying from 85-99%. In the majority of cases where the location code in the migrant survey differed from the survey answer, the location code suggested the survey was filled out in the origin country.

The dropout rate is similar across the different versions of the migrant survey. Over a third of the respondents belonging to the target group completed the survey in full. Most dropout occurs just after the start of the survey. Over a third of respondents doesn't complete the first module on media use. Most of these respondents drop out straight after the filter questions. Most of the remaining drop-out occurs in the module on political trust and political participation. The drop-out seems to mainly occur at matrix questions (e.g. TR02 and TR06, see Appendix 2 for question text). The Qualtrics platform presents matrix questions as separate questions on mobile phones. The second question of the set only appears after the first question has been answered, and so on. While this approach should lead to higher response than showing a matrix (Liu & Cernat, 2018; but see Mavletova et al, 2018), the repetitive format might still deter respondents from continuing

the survey. Qualtrics doesn't provide information on device used for the survey. We therefore can't determine whether this drop-out is more frequent for surveys on mobile devices or PCs.

Table 7. Number of respondents, share of completed surveys and location match by target group and residence country.

| | Target country | Filled in filter questions | Target group | Completed surveys | % Completed of target group | % Location matching country (of completed) |
|----------------------------|------------------|----------------------------|--------------|-------------------|-----------------------------|--------------------------------------------|
| Argentina: migrants | <i>Spain</i> | 927 | 923 | 337 | 36.6% | 98.2% |
| | <i>Germany</i> | 335 | 327 | 142 | 43.4% | 97.2% |
| | <i>UK</i> | 329 | 327 | 136 | 41.6% | 94.9% |
| Argentina: national | <i>Argentina</i> | 4,354 | 4,308 | 1,961 | 45.5% | 99.0% |
| Poland: migrant | <i>Spain</i> | 626 | 574 | 192 | 33.4% | 90.6% |
| | <i>Germany</i> | 1,655 | 1,537 | 536 | 34.9% | 91.8% |
| | <i>UK</i> | 1,562 | 1,431 | 545 | 38.1% | 95.0% |
| Ukraine: migrant | <i>Spain</i> | 1,714 | 1,541 | 529 | 34.3% | 94.7% |
| | <i>Germany</i> | 1,526 | 1,437 | 644 | 44.8% | 93.5% |
| | <i>UK</i> | 865 | 798 | 297 | 37.2% | 85.9% |
| Ukraine: national | <i>Ukraine</i> | 5,593 | 5,042 | 2,151 | 42.7% | 96.7% |

Chi-square tests show a weak but significant relation between number of survey modules completed and political interest for all three migrant surveys ($p < .001$, Cramer's $V .08-.12$). It is likely that this relationship is confounded by education. However, as the demographic questions were initially at the end of the survey (see above) this can only be tested for Argentinian migrants. Here an ordered regression with number of completed modules as dependent shows no significant effect of political interest when controlling for level of education.

The drop-out rate is slightly lower in the national online survey. A little over 44% of respondents in the target group complete the survey in full. Nearly half of those who drop out (a quarter of all respondents) drop out in the media module. As in the migrant survey, most of the other drop-out occurs in the trust and political participation module. In the national surveys drop-out is also significantly related to political interest (χ^2 , $p < .05$, Cramer's $V .06$).

Sample composition and bias

This section examines the distribution of key socio-demographic, social media use and political variables in the migrant survey samples and the national online survey samples. To get a sense of potential sampling bias, data from the national online survey is compared to the national face-to-face surveys.

Migrant surveys

Socio-demographic variables

Women make up the majority of the sample for all three origin country groups and in each of the three destination countries (see Figure 5). The respondents of the survey by Pötzschke & Braun (2017) among Polish migrants were also predominantly women – 66-81% across residence countries. When compared to the available data on the target groups from the national statistics offices of the UK, Germany and Spain, women are overrepresented in the sample (see Table 8).

The ad delivery data show that this overrepresentation already starts when the ad is distributed through Facebook. The ad has more *impressions* for women. This means that Facebook does not distribute the ad evenly.

Figure 5. % female respondents by origin and destination with 95% confidence interval

Note: Complete surveys only.

Table 8. % women in target population according to national data.

| | Target country | % women | Population | Source |
|-----------------------------|----------------|---------|----------------------------------------|------------------------------------|
| Argentinian migrants | Germany | 52% | Argentinian nationals aged 20 and over | Ausländerzentralregister 2019 |
| | Spain | 50% | People born in Argentina | National Statistics Institute 2020 |
| Polish migrants | UK | 53% | People born in Poland | Annual population survey 2019 |
| | Germany | 53% | Polish born aged 20 and over | Mikrozensus 2019 |
| | Spain | 60% | People born in Poland | National Statistics Institute 2020 |
| Ukrainian migrants | UK | 50% | People born in Ukraine | Annual population survey 2019 |
| | Germany | 64% | Ukrainian born aged 20 and over | Mikrozensus 2019 |
| | Spain | 58% | People born in Ukraine | National Statistics Institute 2020 |

The age structure of the samples is similar across origin and destination countries. Of the three origin country groups, Ukrainian respondents are the youngest. About half the sample was born after 1980 (see Figure 6, the line in the middle of the box represents the median age). Argentinians in Spain have the highest age; over half the sample was born before 1970. The Polish sample is considerably older than in the study of Pötzschke & Braun (2017) who found a median age ranging from 33-34 across countries, compared to 42-48 in the MOBILISE samples. This may reflect a change in Facebook use across age groups.

Figure 7 compares the age composition of the MOBILISE sample to that of population data for Germany⁸. The results suggest the age composition of Polish migrants in the MOBILISE sample is very similar to that in the German population. For Argentinian migrants older age groups are

⁸ We have not been able to find similar data from the UK or Spain.

slightly overrepresented, whereas for Ukraine younger age groups are overrepresented in the MOBILISE sample.

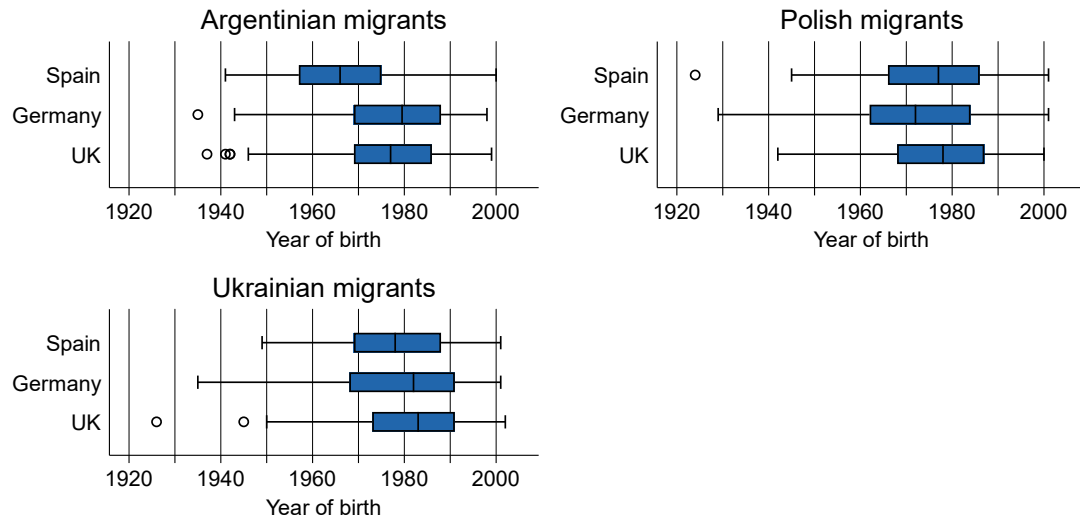

Figure 6. Year of birth by origin and destination country, box & whiskers plot.

Note: Complete surveys only.

Figure 7. Age composition of sample compared to population data migrants aged 20 and over for Germany.

Sources: Mikrozensus 2019 (people born in Poland/ Ukraine), Ausländerzentralregister 2019 (Argentinian nationals).

Another noteworthy characteristic of the sample is that respondents from all origin countries and in all destination countries have a high level of education (see Figure 8). The majority of Argentinian and Ukrainian respondents has attended university. For the Polish sample the share of university educated is nearly half. This is broadly similar to Pötzschke & Braun (2017); in their sample of Polish migrants the share of university educated ranged from 40 to 60%. A comparison with population data for Germany and Spain suggests a substantial oversampling of higher

educated (see Figure 9). Facebook does not have data on education so we do not know if this high share of higher educated is – in part – due to who the algorithm showed the ads to.

Figure 8. Level of education attended by origin and destination country

Note: Complete surveys only.

Figure 9. % higher educated in MOBILISE sample and target population according to national data.

Note: For Germany national data are on people born in Poland/Ukraine for all ages. Source: Mikrozensus 2019. For Spain data are on people born in Argentina/Poland/Ukraine, aged 16+, active in labour market Source: INE inquiry of active population (Q1, 2020). The data does not differentiate between university and other types of tertiary education.

Figure 10. Year of arrival in destination country, by origin and destination country, box & whiskers plot.

Note: Complete surveys only.

The sampling strategy proved successful in reaching recent migrants (see Figure 10, the line in the middle of the box represents the median year of arrival). For most origin country groups around quarter of respondents has been in the current country of residence no more than 5 years at the time of the survey, and just under half of respondents arrived in the last 10 years. German Mikrozensus data⁹ from 2019 show that 12% of Polish migrants arrived less than 5 years ago and 27% less than 5 years ago. For Ukrainian migrants this is 1% and 10%. While recent migrants appear to be oversampled for the purposes of MOBILISE this is the most interesting group, as they made their decision to migrate under recent political-economic conditions.

Figure 11. Social media use, by origin and destination country

Note: Complete surveys only.

⁹ Mikrozensus data is for all ages, whereas the MOBILISE sample is 18+.

Figure 12. Facebook use, by origin and destination country

Note: Complete surveys only.

Social media use

Figures 11 and 12 (previous page) show how often respondents use social media in general and Facebook in particular. Close to 90 per cent of respondents use social media on a daily basis and close to 85 per cent of respondents use Facebook daily.

Political interest and voting

Overall respondents in the migrant samples have a strong interest in politics. Political interest is highest among Argentinian and Ukrainian respondents, around half indicate being “very interested” in politics (see Figure 13). For Polish respondents the share is lower but still 20-30% across destination countries.

Figure 13. Political interest by origin and destination country

Note: Complete surveys only.

The Polish migrant survey was conducted around the time of the October 13, 2019 parliamentary elections. Over 40 percent of respondents indicated they intended to vote or had voted in this election. Table 9 shows a comparison of vote intention (surveys completed before October 13) and reported voting (surveys completed after October 13) and the results of the migrant vote in Germany, the United Kingdom and Spain. The party ranking is similar across the survey and election results, however it is notable that PIS voters are underrepresented in the MOBILISE migrant survey sample.

The Ukrainian migrant survey was also timed close to two elections: the first round of the presidential elections in March 2019 and the July 2019 parliamentary elections. Almost a third of respondents (26% in Spain to 37% in the UK) voted in the presidential elections. Ninety percent of respondents who voted also filled out which candidate they voted for. A comparison between the data from MOBILISE and official election result show a high degree of similarity (see Table 10). About a fifth of respondents (18% in Spain to 27% in the UK) voted in the parliamentary elections. Eighty percent of respondents who voted indicated which party they voted for. Here again the answers in the survey sample are comparable to the official election result.

National surveys

The national surveys were conducted in two modes; the online surveys outlined in this report and face-to-face surveys using a sampling frame set-up to achieve national representativeness. The face-to-face surveys offer an interesting opportunity to explore the quality of the samples collected through FB ads. For the comparison we only use the face-to-face surveys from the main representative sample and exclude the booster sample from the main urban areas.

Argentina entered a COVID-19 related lockdown during the collection of the face-to-face survey data. This meant that the final 159 (out of 2000) interviews had to be conducted via phone. This change did not affect the representativeness of the sample (see MOBILISE data report on face-to-face surveys).

Socio-demographic variables

As in the migrant surveys, women make up the majority of respondents in the national surveys. In Ukraine the share of women is significantly higher in the online survey than in the national survey ($p < .001$), but the size of the difference is modest (see Figure 12). In Argentina, however, there is no difference in gender composition between the online and f2f surveys.

While Hargittai (2020) shows that in the US women and younger people are more likely to be on Facebook, the model developed by Fatehikia et al (2018) suggest that Facebook usage among men and women in Argentina and Ukraine is more or less equal.

Figure 14. % female respondents with 95% confidence interval, by survey mode and country (unweighted)

Note: Complete surveys only.

Whereas Pötzschke & Braun (2017) were concerned about an oversample of young people, and the MOBILISE migrant online sample was on average close to the population age structure, the online survey samples for the national surveys are *older* than the face-to-face survey samples. This is especially the case in Argentina, where half of online survey respondents were born before 1960, compared to quarter of respondents from the face-to-face survey (see Figure 15, the line in the middle of the box represents the median age). According to the population census, 28 per cent of the Argentinian adult population was born before 1960 and about half was born before 1975.¹⁰ Census data for Ukraine, show that nearly half the adult population was born before 1970.¹¹ For both countries the online sample thus have an overrepresentation of older people.

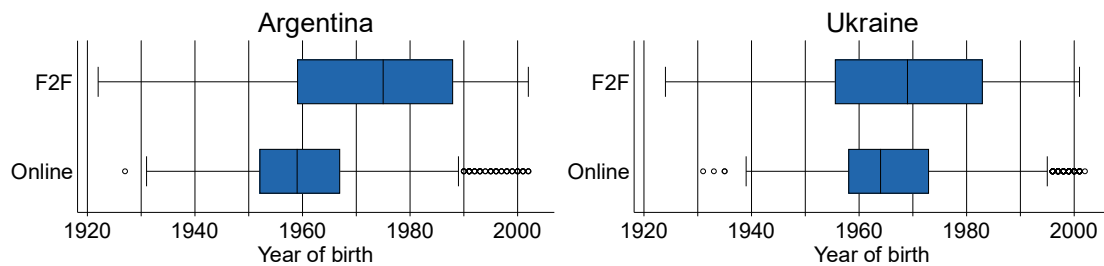

Figure 15. Year of birth, by survey mode and country, box & whiskers plot.

Note: Complete surveys only.

A look at the distribution of education shows that higher educated are overrepresented in the online survey (see Figure 16). The share of university educated respondents is almost twice as high in the online survey compared to the face-to-face survey. This is in line with the high share of university educated in the migrant survey. While part of the overrepresentation is related to a higher share of lower educated dropping out during the online survey, most of the overrepresentation seems to happen at the entry into the survey. This suggests the online recruitment via Facebook has led to an oversample of the highly educated.

¹⁰ Figures from 2010 population census downloaded from <http://data.un.org/>. Per cent is calculated as (number of people born 1911-1959/number of people born 1911-2001). This estimate of the 2020 population structure does not account for variation in death and migration rates between cohorts.

¹¹ Figures for 2018 (excluding Sebastopol and Crimea) downloaded from <http://data.un.org/>. Per cent is calculated as (number of people born 1919-1969/number of people born 1919-2000).

Figure 16. Level of education attended by mode and country

Note: Complete surveys only.

Social media use

Perhaps unsurprisingly, social media use in general and Facebook use in particular are higher for the online samples than the face-to-face samples (see Figure 17 and Figure 18). Sixty-one per cent of the Argentinian face-to-face sample uses Facebook at least once a week. For Ukraine, this is a 36 per cent. This implies the share of the population that can be reached by Facebook ads is larger in Argentina. However the comparison of socio-demographic characteristics does not suggest that the Argentine online sample is more representative than the Ukrainian sample.

Figure 17. Social media use, by survey mode and country

Note: Complete surveys only.

Figure 18. Facebook use, by survey mode and destination country

Note: Complete surveys only.

Political interest and voting

As in the migrant survey, political interest among participants in the online national survey is high. It is also substantially higher than among participants in the face-to-face surveys. The difference cannot be explained by the higher education and age of the online survey respondents. Comparing data from a sample recruited through Facebook ads with a general population surveys Neundorf and Öztürk (2021), also find the Facebook sample had more interest in politics.

Figure 19. Political interest by survey mode and country

Note: Complete surveys only.

In Argentina the national online and face-to-face surveys happened at the same time (see above). Voting is mandatory in Argentina and reported participation in elections is high in both samples: 97% of online and 91% of f2f respondents voted in the second round of the 2019 presidential elections. The higher reported turnout in the online survey remains when controlling for education and political interest. For 2015 the gap is larger, with 97% of the online sample reports having voted compared to 89% in the face-to-face survey. This difference is partially due to the higher age of the online sample. When restricting the sample to those born before 1997, the gap is reduced to 98% and 92% respectively. This gap remains when controlling for the higher political interest and education in the online sample.

Table 12 shows the candidate respondents reported to have voted for in the second round of the presidential elections in Argentina of October 2019. In both samples about 10% of respondents did not name a candidate (refused or don't know). Both survey samples diverge substantially from the official results, but in different direction. The f2f sample has a higher share of reported Fernández/de Kirchner voters, whereas the online sample has a higher share of Macri/Pichetto voters. The difference may reflect a different selection bias, but could also partially be a mode effect with face-to-face participants keener to answer they voted for the “winner” while talking to the interviewer.

Table 12. Candidate voted for (%) in online and face-to-face survey in the October 2019 Argentinian presidential elections (of voters).

| | Online survey | Face-to-face survey | Official results |
|------------------------------------------------------|---------------|---------------------|------------------|

Table 13 shows the candidate voted for in the 2015 presidential elections in Argentina. The question did not specify whether people should report their vote from the first or second round, the answer options included all candidates from the first round. The vote choice of the face-to-face sample is more similar to the official results of the first round, than that of the online sample. It might be because the interviewers instructed respondents to give their first round choice, whereas in the online survey respondents had to decide how to interpret the question without

assistance. However even when comparing to the round two results, voters of the centre-right Macri voters again appear overrepresented, and of the centre-left/Peronist Scioli underrepresented in the online sample .

Table 13. Candidate voted for (%) in online and face-to-face survey in the 2015 Argentinian presidential elections (of voters).

| | Online survey | Face-to-face survey | Official results first round | Official results second round |

https://en.wikipedia.org/wiki/2015_Argentine_general_election#President

In Ukraine the online survey was conducted half a year after the face-to-face survey. This means that questions on parliamentary and presidential elections are on intentions in the face-to-face survey but on behavior in the online survey. Close to 90% of respondents in both the online and face-to-face surveys in Ukraine indicated they voted or intended to vote in the first round of the presidential elections. This is well above the official turnout of 62.87 per cent¹².

Table 14. Candidate voted for (%) in online and face-to-face survey in first round of Ukrainian 2019 presidential elections.

Note: Complete surveys reporting vote preference only

In the online survey, 85% of those who voted, reported the candidate they had voted for. In the face-to-face survey, 64% of respondents reported the candidate they intended to vote for, and 31% indicating it was “hard to say”. The online survey was conducted 7 months after the inauguration of Zelenskyy in May 2019, the face-to-face survey was held before the first round of the elections. Table 14 shows the distribution of the vote for both surveys. For Ukraine the face-to-face survey is the closest reflection of the election result. Poroshenko voters are overrepresented in the online survey, both compared to the round 1 and round 2 election results.

¹² Source: https://en.wikipedia.org/wiki/2019_Ukrainian_presidential_election#Results Accessed on May 6, 2022

This is most likely a reflection of sampling bias, though recall bias might also be higher in the online survey.

Trust in government and judicial system

For Argentina trust in the national government and the judicial system is considerably lower among online survey respondents than face-to-face survey respondents (see Figure 20 and 21).

For the Ukrainian samples, the differences are much smaller. Trust in government is even a bit higher in the online sample. This is somewhat surprising given the underrepresentation of Zelenskyy voters in the sample.

Figure 20. Trust in national government by survey mode and country

Note: Complete surveys only.

Figure 21. Trust in judicial system by survey mode and country

Note: Complete surveys only.

Migration aspirations

For Ukraine reported migration aspirations in the online and face-to-face survey are very similar (see Figure 22). A logistic regression analysis controlling for age, education and gender differences between the two samples also reveals no significant differences in migration aspirations. The question on migration aspirations was – by mistake – not included in the Argentinian online survey, so no comparison could be made here.

Figure 22. Migration aspirations by survey mode and country

Note: Complete surveys only.

Discussion and recommendations

MOBILISE used targeted Facebook advertisements to survey migrants from three different origin countries living in three different destination countries. This sampling method was chosen because it enables obtaining a nation-wide sample that includes recent and irregular migrants and fitted within the budget constraints of the MOBILISE project. To get a sense of how Facebook surveys perform, we also conducted Facebook surveys among the national populations of Argentina and Ukraine and compared this data to that collected through the MOBILISE face-to-face surveys in these countries.

Several lessons can be drawn from the MOBILISE experience of using online surveys with Facebook advertising. As expected this sampling is a cost-effective method to obtaining a large sample. The method seems particularly effective in reaching recent migrants and reaching migrants from small communities such as Argentinians outside Spain or Ukrainians in the UK.

In the 2015-2016 survey of Polish migrants by Pötzschke & Braun (2017) costs amounted to €0.45 per completed questionnaire. For the Polish migrant sample in MOBILISE the costs were €0.53 per target group respondent and €1.45 per completed questionnaire. The higher costs are a likely result of the longer length of the MOBILISE survey and the decreasing use of Facebook among the target population. The latter is reflected in the much lower reach of the MOBILISE ad compared to ad of the 2015-2016 study. Even at this higher cost per survey, the use of Facebook ads is considerably cheaper than other convenience and probability sampling methods.

The efficiency of the ads varied by targeting strategy and groups. Online convenience sampling proved to be a particularly cost-effective way to reach target groups when it came to countries that had languages that were not widely spoken. Targeting Argentinean migrants proved to be more difficult in comparison to Ukrainian and Polish migrants. This is due to the fact that Spanish is a language that is not unique to Argentina, increasing chances that online ads are shown to Spanish-speaking users outside of our target group. Ukrainian and Polish, on the other hand, are languages that are almost exclusively spoken by Ukrainians and Poles. It is therefore easier to target Ukrainian and Polish migrants. For groups with widely spoken languages we advise against using language as part of the targeting strategy.

While the Facebook advertising is a highly efficient sampling method, this comes at the cost of sampling bias. For the MOBILISE survey the main bias appears to be oversampling of higher educated and politically interested¹³. However, several other variables, including political preferences show more similarities to population data. Interestingly, women are slightly overrepresented in the MOBILISE surveys – this contrasts the findings from Neundorf and Öztürk (2021) who undersample women. It is not clear what might explain this difference. The ad text used in their study shows broad similarities¹⁴ to that used in the MOBILISE national surveys.

Pötzschke & Braun (2017) expected that younger cohorts would be more likely to engage with Facebook ads than older cohorts. For the national surveys we found an overrepresentation of older cohorts. Neundorf & Öztürk (2021) found the same in their study in four countries. This may reflect the change in Facebook usage among younger people that has taken place since Pötzschke Braun's study. Instagram has gained popularity, particularly among younger cohorts. Instagram offers an advertising option, which is based on the targeting information from Facebook, its parent company. For future studies advertising on Instagram can be a good alternative for or supplement to advertising through Facebook. Alternatively, the Facebook ads can be split in ad-sets for

¹³ Neundorf & Öztürk (2021) find similar bias in their samples from the UK, Turkey, Spain and Czechia.

¹⁴ Body text: "We value your opinion! Do you want to participate in this survey on current issues conducted by the University of Glasgow researchers." Link text: "Make your voice heard".

different age groups and other demographic groups. The study by Neundorf & Öztürk (2021) suggests targeting can substantially reduce bias in age, gender and education level, especially when combining multiple criteria (e.g. women of a certain age-group). However, even with targeting significant biases are likely to remain.

In the MOBILISE surveys, more than half of respondents dropped out during the survey. As drop-out seems to occur especially at matrix questions, we recommend keeping these to a minimum. We furthermore recommend asking key demographic questions at the start of the survey. This allows a more elaborate analysis of the factors related to drop-out and way incomplete responses can be included in the analyses with control variables.

To our surprise, we uncovered duplicates among the survey entries. Future surveys should make sure they have an approach to detecting duplicates in the data. It would be good to prevent duplicates from occurring, but this is challenging to do. Using the Qualtrics option to prevent ballot stuffing, will only prevent duplicates that come from the same device. Furthermore this option might deter participants who do not accept browser cookies, which can lead to sampling bias.

In sum, our study showed the potential of running surveys through Facebook. This approach is particularly effective when surveying migrants. A group that is notoriously difficult to reach through probability methods, especially in the case of small and or recently arrived communities. Notable benefits compared to other convenience methods such as centre-point point or sampling through community organisations are that this method has a nation-wide reach and even though it is based on an online social network, it is more likely to lead to a sample that has fewer interconnections than other methods.

Appendices

Appendix 1. Targeting strategies for MOBILISE Facebook ads – first wave

| | Type ad | Location | Age | Language | People who match |
|----------------------------|-------------------------------------------------------------------|---------------------|----------|-----------|--------------------------------------------------------------|
| Poland: migrant | Germany/UK/Spain – <i>lived in Poland</i> | Germany, UK, Spain | 18 - 65+ | -- | Behaviours: Lived in Poland (formerly Expats – Poland) |
| Ukraine: migrant | Germany/UK/Spain – <i>language (Ukr)</i> | Germany, UK, Spain, | 18 – 65+ | Ukrainian | -- |
| | Germany/UK/Spain – <i>language (Ukr) /interest/away from home</i> | Germany, UK, Spain | 18 - 65+ | Ukrainian | Interests: Ukraine; Life event: Away from hometown |
| | Germany/UK/Spain – <i>language (Rus) /interest</i> | Germany, UK, Spain | 18 - 65+ | Russian | Interests: Ukraine |
| Ukraine: national | Ukraine – <i>language (Ukr)</i> | Ukraine | 18 - 65+ | Ukrainian | -- |
| | Ukraine – <i>language (Rus)</i> | Ukraine | 18 - 65+ | Russian | -- |
| Argentina: migrant | Germany – <i>lived in Argentina</i> | Germany | 18 - 65+ | -- | Behaviours: Lived in Argentina (formerly Expats – Argentina) |
| | Germany – <i>language</i> | Germany | 18 - 65+ | Spanish | Interests: Argentina |
| | UK – <i>lived in Argentina</i> | UK | 18 - 65+ | -- | Behaviours: Lived in Argentina (formerly Expats – Argentina) |
| | UK – <i>language</i> | UK | 18 - 65+ | Spanish | Interests: Argentina |
| | Spain – <i>lived in Argentina</i> | Spain | 18 - 65+ | -- | Behaviours: Lived in Argentina (formerly Expats – Argentina) |
| | Spain – <i>language</i> | Spain | 18 - 65+ | Spanish | Interests: Argentina |
| Argentina: national | Argentineans in Argentina | Argentina | 18 - 65+ | -- | -- |

Note: language strategy was suspended after three weeks in the Argentina migrant ad, only expat ads continued

MOBILISE - Ukrainian/Russian version

Start of Block: Filter

START *If you would like to take this survey in Ukrainian or Russian, click on [English] in the top-right corner of the screen, and select the language.* We are conducting a survey of people from Ukraine who live in the United Kingdom, Germany, and Spain, in order to understand what people think about their life, politics and other important challenges facing Ukraine.

We are a group of researchers from the United Kingdom, Germany, France and the Netherlands. The study is funded by national science foundations under the Open Research Area Funding Scheme (www.mobiliseproject.com).

Your answers will remain confidential. Reports on the study will only mention general patterns, not individual responses. Participation in the study is completely voluntary. Participation takes about twenty minutes. We are very interested in your frank answers. If you do not want to answer a question, you can select the option 'prefer not to say'. You are free to stop your participation at any time. You can find more information on the project, how we will use the data from the survey and your rights as participant here: http://www.mobiliseproject.com/info_ukr.

Please note: You must be 18 or older to participate in this study.

By completing this survey, you are consenting to participate in our study.

Thank you for your help and cooperation.

End of Block: MEDIA

Start of Block: POLITICS

POL00 We would now like to ask you some questions about your interest in politics.

POL01 How interested would you say you are in politics – are you...

- ☐ Very interested (1)
- ☐ Quite interested (2)
- ☐ Hardly interested (3)
- ☐ Not at all interested (4)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

POL02 Do you follow the political events in \${F01/ChoiceGroup/SelectedChoices}¹⁵?

- ☐ Yes, to some extent (1)
- ☐ No, not at all (2)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

Display This Question:

If Do you follow the political events in \${q://QID73/ChoiceGroup/SelectedChoices}? = Yes, to some extent

¹⁵ During the survey, this code gets replaced with the country that respondents specified in question F02.

POL03 What is your main source of information about political events in [\\${F01/ChoiceGroup/SelectedChoices}](#)? Please select ONE main source.

- ☐ TV (1)
- ☐ Radio (2)
- ☐ Newspapers (online or offline) (3)
- ☐ Other websites (4)
- ☐ Facebook (5)
- ☐ Whatsapp (6)
- ☐ Family and friends (7)
- ☐ Other: (8) _____
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

 Page Break _____

POL04 Do you follow the political events in \${F02/ChoiceGroup/SelectedChoices}?

- ☐ Yes (1)
- ☐ No (2)
- ☐ Don't know (97)
- ☐ Prefer not to say (98)

Display This Question:

If Do you follow the political events in \${q://QID80/ChoiceGroup/SelectedChoices}? = Yes

POL05 What is your main source of information about political events in \${F02/ChoiceGroup/SelectedChoices}? Please select ONE main source.

- ☐ TV (1)
- ☐ Radio (2)
- ☐ Newspapers (online or offline) (3)
- ☐ Other websites (4)
- ☐ Facebook (5)
- ☐ Whatsapp (6)
- ☐ Family and friends (7)
- ☐ Other: (8) _____
- ☐ Don't know (97)
- ☐ Prefer not to say (98)

End of Block: POLITICS

Start of Block: DEMOGRAPHICS SHORT

DEM.SHORT.00 We would now like to ask you some questions about your personal situation.¹⁶

DEM16 Could you please tell me your year of birth? (YYYY)

DEM17 Please tell me, are you...

- ☐ A man (1)
- ☐ A woman (2)
- ☐ *Prefer not to say* (98)

¹⁶ This section was created halfway through the Ukrainian migrant survey, so that basic demographic information could be collected earlier in the survey. In the Polish survey (which was published earlier), these questions were part of the regular Demographics section, near the end of the survey.

DEM.UKR.01 What is your level of education?

- ☐ No formal education (1)
- ☐ Primary education (2)
- ☐ Some high school/secondary education (3)
- ☐ High school/secondary school (4)
- ☐ Professional tertiary education (5)
- ☐ Incomplete higher or tertiary or university education (6)
- ☐ Higher or tertiary or university education (7)
- ☐ PhD (8)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

End of Block: DEMOGRAPHICS SHORT

Start of Block: POLITICAL TRUST

TR00 We would now like to ask you some questions about your trust in people and institutions.

TR01 Generally speaking, would you say that most people can be trusted, or that one can never be too careful in dealing with people? Please tell me on a score of 0 to 10, where 0 means you can't be too careful and 10 means that most people can be trusted.

- ☐ You can't be too careful 0 (0)
- ☐ 1 (1)
- ☐ 2 (2)
- ☐ 3 (3)
- ☐ 4 (4)
- ☐ 5 (5)
- ☐ 6 (6)
- ☐ 7 (7)
- ☐ 8 (8)
- ☐ 9 (9)
- ☐ Most people can be trusted 10 (10)
- ☐ *Don't know* (11)
- ☐ *Prefer not to say* (12)

Page Break

TR02 Below is a list of institutions. Please indicate, in general, how much you trust each of the following (types of) institutions:

| | Do not trust at all (1) | Do not trust very much (2) | Neither trust nor distrust (3) | Quite trust (4) | Trust completely (5) | <i>Don't know</i> (97) | <i>Prefer not to say</i> (98) |
|------------------------------------------------------------------|-------------------------------------|-------------------------------------------|--------------------------------------------|-----------------------|----------------------------|-------------------------------|------------------------------------------|
| Government of \${F01/ChoiceGroup/SelectedChoices} (6) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Parliament of \${F01/ChoiceGroup/SelectedChoices} (7) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Judicial system of \${F01/ChoiceGroup/SelectedChoices} (8) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

Page Break

TR03 In some countries, people believe that their elections are conducted fairly. In other countries people believe that their elections are conducted unfairly. Do you believe that, generally speaking, elections in [\\${F01/ChoiceGroup/SelectedChoices}](#) are fair? Please use a 5-point scale, where 1 means that elections are generally conducted fairly, and 5 means that elections are generally conducted unfairly.

Elections are rather likely to be held...

- ☐ FAIRLY 1 (1)
- ☐ 2 (2)
- ☐ 3 (3)
- ☐ 4 (4)
- ☐ NOT FAIRLY 5 (5)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

Page Break

TR04 How many people in your circle of friends and family criticize the current political situation in [\\${F01/ChoiceGroup/SelectedChoices}](#)?

- ☐ None (1)
- ☐ Some (2)
- ☐ Majority (3)
- ☐ All (4)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

Page Break

TR05 When you were living in \${F01/ChoiceGroup/SelectedChoices}, did you ever refrain from political activities in \${F01/ChoiceGroup/SelectedChoices} because you faced potential threats?

- ☐ Never (1)
- ☐ Rarely (2)
- ☐ Sometimes (3)
- ☐ Often (4)
- ☐ All of the time (5)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

Page Break

TR06 How likely do you think it is, that people who are politically active in [\\${F01/ChoiceGroup/SelectedChoices}](#) will face the following threats?

| | Very unlikely (1) | Unlikely (2) | Likely (3) | Very likely (4) | Don't know (97) | Prefer not to say (98) |
|------------------------------------------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|------------------------|
| Being arrested or detained (1) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Being hurt by security forces (2) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Getting problems on the job or at university (3) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Getting problems for close family members (4) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Being recorded and harm their life in the future (5) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Being forced to flee the country (6) | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

Page Break

TR07 Have you been involved in any of the following types of organizations in the past 12 months?
Please indicate whether you were a member, a supporter, or neither.

| | Member (1) | Supporter (2) | Neither member nor supporter (3) | <i>Don't know</i> (97) | <i>Prefer not to say</i> (98) |
|-------------------------------------------------------------------------------------------------|-----------------------|-----------------------|----------------------------------------------|-------------------------------|---------------------------------------|

DEM18 How has your family's financial situation changed over the past twelve months?

- ☐ Has significantly improved (1)
 - ☐ Has somewhat improved (2)
 - ☐ Remains unchanged (3)
 - ☐ Has deteriorated somewhat (4)
 - ☐ Is much worse (5)
 - ☐ *Don't know* (97)
 - ☐ *Prefer not to say* (98)
-

DEM19 In general, have you gained/won or lost as a result of the economic changes that have taken place since the independence of Ukraine?

- ☐ Gained/won (1)
 - ☐ Mostly gained/won (2)
 - ☐ Mostly lost (3)
 - ☐ Lost (4)
 - ☐ Something was gained/won, something was lost (5)
 - ☐ It's hard to compare, I was too young then (6)
 - ☐ *Don't know* (7)
 - ☐ *Prefer not to say* (97)
-

DEM20 How much do you worry that you or a member of your family may lose their job in the next 12 months?

- ☐ Very concerned (1)
- ☐ Concerned (2)
- ☐ Not very concerned (3)
- ☐ Not concerned at all (4)
- ☐ *Not applicable* (96)
- ☐ *Don't know* (97)
- ☐ *Prefer not to say* (98)

End of Block: DEMOGRAPHICS

Start of Block: NEXT WAVE

NEXT01 Thank you for taking the time to answer our questions! We would like to send you another, shorter survey, 12-18 months from now. Would you be willing to participate again?

- ☐ Yes, I might be willing (1)
- ☐ No, I definitely don't want to participate again (2)

Display This Question:

If Thank you for taking the time to answer our questions! We would like to send you another, shorter... = Yes, I might be willing

NEXT02 To allow us to contact you again, we need to have your email address. Your email address will be stored separately from the answers you gave to the survey questions. It will be stored on a secure server. Could you provide us with your email address for the purpose of sending you a survey 12-18 months from now?

End of Block: NEXT WAVE

Appendix 3. Project Information Sheet

Argentinian version: https://mobiliseproject.com/info_arg/
 Polish version: https://mobiliseproject.com/info_pol
 Ukrainian version: https://mobiliseproject.com/info_ukr/
 Ukrainian-Russian version: https://mobiliseproject.com/info_ukr_rus/

You can download the below information as pdf file by clicking here {LINK TO FULL INFORMATION SHEET}.

ABOUT THE PROJECT

What is the goal of this survey?

This survey is part of a larger study called 'MOBILISE'. The MOBILISE project wants to learn about the outlook of people from Ukraine, Poland, Morocco and Argentina. Specifically about their assessment of their life, politics and important challenges in their country, and about people's behaviour.

MOBILISE has collected survey data in Ukraine, Poland, Morocco and Argentina. We would like to learn how the lives and attitudes of people in these countries compare to people who have left these countries (migrants) and now live in Germany, the United Kingdom, and Spain.

Which countries are included?

MOBILISE covers Argentina, Morocco, Poland, and Ukraine. These countries were chosen because they all have seen large-scale emigration and recent protest. This makes them highly relevant cases to study the relations between people's assessment of their life, politics and important challenges in their country, and people's behaviour.

Who is funding this research?

The study is funded by the national science foundations of Germany (DFG), United Kingdom (ESRC), France (ANR), and Netherlands (NWO) as part of the collaborative scheme ORA.

Who has reviewed this research project?

This project has been reviewed by Open Research Area Committee and by separate committees/persons at the ESRC in the UK, DFG in Germany, ANR in France and NWO in the Netherlands.

Who is leading this research?

The MOBILISE project is made up of four country teams, the ZOIS in Germany, University of Manchester and University of Oxford in the United Kingdom, ENSAE in France, and the Vrije Universiteit Amsterdam and the University of Amsterdam in the Netherlands.

For information on all team members see {link to 'about us' page on project website}.

The online survey is led by Dr. Evelyn Ersanilli of the University of Amsterdam.

YOUR INVOLVEMENT

What will you do with my data/answers?

We will use the survey data to write academic publications, blogs and policy briefs. We will only use aggregate data such as averages (for example "60% of the people who answered the survey, indicated that they had voted in the last election", or "migrants who are often in touch with their family back home, more often remit money to their family members").

Can I stop the survey if I don't want to participate anymore?

You can stop the survey at any point.

Will I be compensated for taking part?

You will not receive any payment or compensation for your time.

DATA PROTECTION AND CONFIDENTIALITY

Will my participation in the study be confidential?

Your participation will be kept confidential.

Who will have access to the data?

Your answers will be stored in a dataset on a secure server that meets requirement of data protection laws. Only the researchers in the project (you can find their names here {[link to 'about us'](#)}) will have access to this dataset. This dataset will not contain your name or contact details.

The project ends in 2022. After the project, the dataset will be deposited in a 'data archive' for scientific data. Researchers outside the project may request access to the dataset to use it for academic publications, blogs or policy briefs.

What information will you collect about me?

In addition to the answer you give to the survey questions, the survey software automatically collects your IP address. This is a unique number belonging to your internet connection. We will use the IP address only to check for irregularities (for example the same address being connected to multiple surveys, bots, or addresses linked to countries not included in our project). After this check the IP address will be deleted from the datafiles.

I've indicated I'm willing to be contacted about a second round of the survey and entered my email address for this purpose. How will you store and use my email address?

Email address are stored in a file together with an ID number. The file with email addresses is separate from the dataset with answers to the survey questions and is only accessible to the Dutch team (VU/UvA). All datafiles will be held on secure servers that meet data protection requirements regulations.

The email addresses will only be used to send out a second survey in 12-18 months. We will use the ID number to connect answers from the first and second survey. The file with email addresses will be destroyed within one year of the second survey. It will not be shared with anyone outside the project.

I've indicated I'm willing to be contacted about a second round of the survey and entered my email address. I have changed my mind. Can you remove my address from the file?

Yes we can. Please contact Dr. Evelyn Ersanilli ([e.f.ersanilli @ uva.nl](mailto:e.f.ersanilli@uva.nl)) – lead of this online survey data collection - of the University of Amsterdam and your email address will be removed.

Who can I contact with questions or concerns?

You can contact Dr. Evelyn Ersanilli ([e.f.ersanilli @ uva.nl](mailto:e.f.ersanilli@uva.nl)) the University of Amsterdam or the research ethics officer of the Amsterdam Institute for Social Science Research (AiSSR), Ms Yomi van der Veen {[link to y.m.vanderveen@uva.nl](mailto:y.m.vanderveen@uva.nl)}
